IHC: Formalin-fixed, paraffin-embedded human melanoma stained with CD146 antibody (clone MUC18/1130).

IHC: Formalin-fixed, paraffin-embedded human melanoma stained with CD146 antibody (clone MUC18/1130).

Description

The human Mel-CAM gene maps to chromosome 11q23 and encodes a trans-membrane glycoprotein, also designated MCAM, MUC 18 or CD146, that belongs to the immunoglobulin superfamily and functions as a Ca^{2+} -independent cell adhesion molecule. CD146 expression is restricted to advanced primary and metastatic melanomas and to cell lines of the neuroectodermal lineage, but not normal melanocytes. It is found on 80% of advanced primary human melanomas and correlates well with development of metastatic disease.

Application Notes

Optimal dilution of the CD146 antibody should be determined by the researcher.

1. Staining of formalin-fixed tissues requires boiling tissue sections in 10mM Tris with 1mM EDTA, pH 9.0, for 10-20 min followed by cooling at RT for 20 min
2. The prediluted format is supplied in a dropper bottle and is optimized for use in IHC. After epitope retrieval step (if required), drip mAb solution onto the tissue section and incubate at RT for 30 min.

Immunogen

Recombinant human protein was used as the immunogen for the CD146 antibody.

Storage

Store the CD146 antibody at 2-8°C (with azide) or aliquot and store at -20°C or colder (without azide).
