## **Description**

This gene encodes a member of the cytochrome P450 superfamily of enzymes. The cytochrome P450 proteins are monooxygenases which catalyze many reactions involved in drug metabolism and synthesis of cholesterol, steroids and other lipids. This protein localizes to the endoplasmic reticulum and its expression is induced by rifampin. The enzyme is known to metabolize many xenobiotics, including phenytoin, tolbutamide, ibuprofen and S-warfarin. Studies identifying individuals who are poor metabolizers of phenytoin and tolbutamide suggest that this gene is polymorphic. The gene is located within a cluster of cytochrome P450 genes on chromosome 10q24.

### **Application Notes**

Optimal dilution of the CYP2C9 antibody should be determined by the researcher.

#### **Immunogen**

A portion of amino acids 1-200 from the human protein was used as the immunogen for the CYP2C9 antibody.

#### **Storage**

Aliquot the CYP2C9 antibody and store frozen at -20oC or colder. Avoid repeated freeze-thaw cycles.
