Description

DKK1, also called Dickkopf-1 and Dickkopf-related protein 1, is a protein that in humans is encoded by the DKK1 gene. This gene encodes a protein that is a member of the dickkopf family. By genomic sequence analysis, determined that the DKK1 gene contains 4 exons. The DKK1 gene is mapped to 10q11.2 using FISH. It is a secreted protein with two cysteine rich regions and is involved in embryonic development through its inhibition of the WNT signaling pathway. Elevated levels of DKK1 in bone marrow plasma and peripheral blood is associated with the presence of osteolytic bone lesions in patients with multiple myeloma.

Application Notes

Optimal dilution of the Dickkopf-1 antibody should be determined by the researcher.

Immunogen

Recombinant mouse protein (amino acids N73-H272) was used as the immunogen for the Dickkopf-1 antibody.

Storage

After reconstitution, the Dickkopf-1 antibody can be stored for up to one month at 4°C. For long-term, aliquot and store at -20°C. Avoid repeated freezing and thawing.
