Description

MDM2 is a nuclear phosphoprotein that binds and inhibits transactivation by tumor protein p53. It can promote tumor formation by targeting tumor suppressor proteins, such as p53, for proteasomal degradation. Overexpression of MDM2 can result in excessive inactivation of tumor protein p53, diminishing its tumor suppressor function. This protein also affects the cell cycle, apoptosis, and tumorigenesis through interactions with other proteins, including retinoblastoma 1 and ribosomal protein L5. Overexpression of MDM2 protein is detected in a variety of cancers.

Application Notes

Optimal dilution of the MDM2 antibody should be determined by the researcher.

Immunogen

Amino acids 154-167 were used as the immunogen for the MDM2 antibody.

Storage

Store the MDM2 antibody at 2-8°C (with azide) or aliquot and store at -20°C or colder (without azide).
