IHC testing of FFPE rat lung with Nuclear Antigen antibody (clone NUCM1-1). FFPE testing requires sections to be boiled in pH 9 10mM Tris with 1mM EDTA for 10-20 minutes, followed by cooling at RT for 20 minutes, prior to staining.

IHC testing of FFPE human tonsil with Nuclear Antigen antibody (clone NUCM1-1). FFPE testing requires sections to be boiled in pH 9 10mM Tris with 1mM EDTA for 10-20 minutes, followed by cooling at RT for 20 minutes, prior to staining.

Immunofluorescent staining of PFA-fixed human HeLa cells with Nuclear Marker antibody (green, clone NUCM1-1) and Phalloidin (red).

## Description

This mAb recognizes an antigen associated with the nuclei in cells. It can be used to stain the nuclei in cell or tissue preparations and can be used as a nuclear marker in subcellular fractions.

## Application Notes

Titration of the Nuclear Antigen antibody may be required for optimal performance.

1. The prediluted format is supplied in a dropper bottle and is optimized for use in IHC. After epitope retrieval step (if required), drip mAb solution onto the tissue section and incubate at RT for 30 min.

## Immunogen

Human cell nuclei were used as the immunogen for the Nuclear Antigen antibody.

## Storage

Store the Nuclear Antigen antibody at 2-8°C (with azide) or aliquot and store at -20°C or colder (without azide).
