Description

Cyclin-dependent kinase-4 (CDK4) is a protein-serine kinase involved in the cell cycle. It is essential for the G1- to S-phase transition during the cell cycle and its expression is primarily controlled at the transcriptional level. CCND1- CDK4 axis is not only critical in glial tumor cells but also in stromal-derived cells in the surrounding tumor microenvironment that are vital to sustain tumor outgrowth. CDK4 is highly expressed in highly differentiated and dedifferentiated liposarcomas, but rarely expressed in other benign liposarcomas and other sarcomas. CDK4 and MDM2 combined to differentiate between highly differentiated liposarcoma (+), dedifferentiated liposarcoma (+) and myxoid liposarcoma, pleomorphic liposarcoma, spindle lipoma, pleomorphic lipoma and other high-grade sarcomas.

Application Notes

Optimal dilution of the recombinant CDK4 antibody should be determined by the researcher.

Immunogen

A recombinant fragment corresponding to the N-terminal of human CDK4 protein was used as the immunogen for the recombinant CDK4 antibody.

Storage

Aliquot the recombinant CDK4 antibody and store frozen at -20°C or colder. Avoid repeated freeze-thaw cycles.
