Description

The protein encoded by this gene binds copper and zinc ions and is one of two isozymes responsible for destroying free superoxide radicals in the body. The encoded isozyme is a soluble cytoplasmic protein, acting as a homodimer to convert naturally-occurring but harmful superoxide radicals to molecular oxygen and hydrogen peroxide. The other isozyme is a mitochondrial protein. Mutations in this gene have been implicated as causes of familial amyotrophic lateral sclerosis. [RefSeq]

Application Notes

Optimal dilution of the SOD1 antibody should be determined by the researcher.

Immunogen

A synthetic peptide specific to human SOD1 was used as the immunogen for the SOD1 antibody.

Storage

Store the SOD1 antibody at -20oC.
